NexPath Landing Page Content

Review note

This document carries forward the full first-version page so the copy can be reviewed in context. Sections that did not need copy changes are retained as written in the first version. The requested structural changes are applied: the standalone multi-agent section is folded into Enterprise Privacy, GPU content is a subsection of Enterprise Privacy, and premium availability is Desktop-only. The first CTA button is **Join Waitlist**.

1. HERO SECTION — UPDATED

Eyebrow:
THE HUMAN-IN-THE-LOOP LAYER FOR AI CODING

Your AI coding agents can do the work. NexPath helps make sure they do the right work.

NexPath works alongside your coding agents to improve software engineering guidance, maintain project context, and bring you into the loop when your judgment matters.

From better prompts to background verification and privacy-focused local AI workflows, NexPath helps you build more maintainable software while optimizing time and token costs.

CTA button: Join Waitlist

Supporting highlights:

- Human-in-the-loop development
- Intelligent context engineering
- Background verification
- Privacy-focused local AI

2. HOW IT WORKS — PROMPT ENHANCEMENT

Eyebrow: PROMPT ENHANCEMENT

Better guidance before your coding agent starts.

A coding agent is only as effective as the instructions and context it receives. NexPath strengthens your prompts with relevant software engineering guidance, helping your agent work toward clearer requirements, better implementation decisions, and more maintainable code.

Understand your intent

NexPath considers your request and relevant session context to understand what you want to accomplish without unnecessarily changing your original intent.

Structure the task

It organizes your requirements into a clearer, more actionable prompt that helps your coding agent understand the intended scope and expected outcome.

Apply software engineering guidance

Relevant guidance can help your agent account for maintainability, verification, safety, and other engineering considerations appropriate to the task.

Keep control when it matters

Prompt enhancement can run automatically, with a six-second cancellation window so you can stop the automatic enhancement when necessary.

NexPath aims to reduce unnecessary interruptions while keeping you in control of how your coding workflow operates.

Supporting line:
Less time refining instructions. More attention on the engineering decisions that matter.

3. CONTEXT ENGINEERING & PROJECT MEMORY

Eyebrow: INTELLIGENT CONTEXT

Your project has a memory. Your coding agent should have the right context, too.

Important project decisions do not always belong to the current conversation. Architecture choices, earlier implementation details, established conventions, and lessons learned can remain relevant long after the original discussion.

NexPath's Context Engineering capabilities are designed to help preserve that knowledge and bring relevant context back when it matters.

Remember beyond the current session

Important project context can remain useful even when it was recorded weeks or months earlier.

Learn project patterns

Pattern recognition helps identify recurring information and relationships within a project's accumulated context.

Retrieve what matters for the task

Instead of relying exclusively on whatever happens to be present in the current conversation, NexPath aims to make relevant historical context available when a task calls for it.

Maintain continuity across coding agents

When you move between coding agents, relevant project knowledge can help keep their understanding aligned with the decisions and conventions established earlier.

Supporting line:
Not just longer memory. More useful context at the right time.

Context Engineering is part of NexPath's open-source foundation.

4. ENTERPRISE PRIVACY & INTERNAL DEVICE NETWORK — UPDATED; INCLUDES MULTI-AGENT AND GPU SUBSECTIONS

Eyebrow: ENTERPRISE CAPABILITIES

Your code. Your infrastructure. Your control.

AI-assisted development introduces an important question: where does your project information go when a coding agent processes it?

NexPath brings privacy-focused local AI workflows to developers who need greater control over how their code and project context are processed.

Use your internal device network

Connect supported internal devices and use compatible local models running on your own hardware, including GPUs where supported.

Activate Data Privacy Mode

When Data Privacy Mode is enabled and correctly configured, model inference in the protected workflow is restricted to designated internal models rather than external model APIs. Your code and project information for that inference remain within the configured internal device network.

If a task needs a capability that the configured internal models cannot provide, NexPath brings you into the decision. Data Privacy Mode does not silently fall back to an external model API.

Work with different coding agents and keep context aligned

Use different coding agents for different tasks. Context Engineering helps keep important project context available as you switch, so you do not have to rebuild the same project understanding each time.

NexPath can also bring you into the loop when a task may be handled by a more suitable or more cost-effective agent. Smaller tasks that do not need a premium model may be handled by an appropriate lower-cost or local option, helping reduce unnecessary subscription or token costs without lowering the quality bar for the work.

Put your internal GPUs to work

You do not need to manually choose a local model for every task. When Data Privacy Mode is on, suitable work is routed to compatible models on your configured internal device network. Model selection is automatic within that protected setup; external model APIs are not used. Suitability and performance depend on the model, hardware, and task.

Support mature software engineering

Enterprise capabilities extend the open-source foundation with evidence-based software engineering workflows that support maintainability and more deliberate verification.

Supporting line:
Enterprise privacy capabilities, with the focus still on better software engineering and developer control.

5. BACKGROUND MODE & HUMAN-IN-THE-LOOP DEVELOPMENT — UPDATED

Eyebrow: MORE PRODUCTIVE DEVELOPMENT

Let suitable work run in the background. Step in when your judgment matters.

Not every development task needs your attention from beginning to end. Testing, verification, and other suitable follow-up work can take time, even when they do not need continuous supervision.

Start background mode when you want a suitable task to continue while you focus on other work, or let NexPath surface the option when a task is ready for background verification. Work can make progress while you are waiting on a coding agent or using time when a subscription would otherwise be idle.

Save time and optimize token costs

For suitable tasks, NexPath can use a more cost-effective coding agent or a configured local model instead of routing every step through a premium model. This can reduce unnecessary token costs while the primary coding agent remains available for work that needs it.

The agent and model should still fit the task. Cost optimization does not mean accepting weaker verification or compromising the quality required for the work.

Return to the loop when it matters

Background work does not remove you from important decisions. When a task needs clarification, approval, or engineering judgment, NexPath brings you back into the loop.

You remain the decision-maker. The aim is to save waiting time and reduce repetitive coordination while keeping you involved where your judgment makes a difference.

Supporting line:
Spend less time waiting. Reduce unnecessary token costs. Stay involved where your judgment matters.

6. SUPPORTED ACROSS YOUR WORKFLOW — UPDATED

Eyebrow: BUILT AROUND YOUR DEVELOPMENT WORKFLOW

Your tools. Your workflow. One familiar way to work.

NexPath is designed to complement the tools developers already use rather than require an entirely different development process.

NexPath Desktop App

The Desktop App is the current home of NexPath's premium capabilities, including Data Privacy Mode, the internal device network, and supported background workflows.

Browser Extension

Use the browser extension for its supported NexPath functionality within compatible browser-based workflows. Premium capabilities are not currently available through the Browser Extension.

VS Code Extension

Bring supported NexPath functionality into compatible editor workflows. Premium capabilities are not currently available through the VS Code Extension.

NexPath CLI

Access supported command-line functionality from your terminal. Premium capabilities are not currently available through the CLI.

Supporting line:
Premium capabilities are currently available through the Desktop App only.

7. SWE-BENCH VERIFIED

Eyebrow: MEASURED BY PROJECT TESTS

Better prompts. Measurable results.

Prompt quality should be evaluated through evidence, not just claims.

In the reported NexPath CLI evaluation using 40 SWE-Bench Verified tasks, Claude Code solved 29 tasks with NexPath's prompt enhancement, compared with 27 tasks without NexPath under the stated test setup.

Results from the reported evaluation

With NexPath: 29 of 40 tasks solved — 72.5%

Without NexPath: 27 of 40 tasks solved — 67.5%

The results indicate an improvement in the number of tasks solved in this particular evaluation.

The benchmark should be interpreted within its stated experimental setup. It does not establish that every task, model, coding agent, or development environment will experience the same improvement.

CTA: Read the Benchmark Report

8. PRIVACY & SECURITY

Eyebrow: PRIVACY BY DESIGN

Understand where your project information goes.

Developers should be able to make informed decisions about how their project information is handled.

NexPath's privacy approach includes local handling of supported data, protections for stored information, and additional privacy-focused workflows through its internal device network.

Local data handling

Supported local functionality can keep its associated data on your device rather than requiring repository uploads to NexPath.

Secret redaction

Supported prompt-storage workflows can remove recognized secrets, such as API keys and tokens, before storing prompts.

Control over local history

Manage or clear locally stored prompt history through the supported controls.

Local-model inference

When Data Privacy Mode is enabled and correctly configured, supported model inference can be restricted to your internal device network.

This helps developers use compatible local models for workflows that require greater control over external model API usage.

Important distinction: Local storage, secret redaction, and local-model inference are different protections. Their guarantees should be documented separately so users understand what each feature does and what remains outside its scope.

9. WHAT NEXPATH IS — AND ISN'T

Eyebrow: A DIFFERENT LAYER IN YOUR WORKFLOW

NexPath works with your coding agents, not instead of them.

NexPath is designed to improve the way you work with AI coding agents while keeping developers involved in important decisions.

It is not intended to replace every coding agent with a new, all-in-one agent.

NexPath is a human-in-the-loop layer

It helps improve prompts, maintain relevant project context, support suitable background workflows, and involve developers when their input matters.

NexPath is not another coding agent

You can continue using the coding agents that suit your tasks and workflow.

NexPath is not a replacement for engineering judgment

Automation can reduce repetitive work, but developers remain responsible for important technical decisions, appropriate verification, and the quality of the resulting software.

NexPath is not simply a prompt wrapper

Its broader direction includes context engineering, privacy-focused local workflows, and ways to make interactions between developers and coding agents more effective.

Supporting line:
Your coding agents do the work. NexPath helps make the workflow more effective, controlled, and maintainable.

10. OPEN SOURCE & ENTERPRISE CAPABILITIES — UPDATED

Eyebrow: OPEN SOURCE, WITH MORE TO EXPLORE

An open-source foundation. Additional capabilities for demanding workflows.

NexPath's open-source foundation is central to its identity. Prompt Enhancement is already open source, and Context Engineering is part of the open-source foundation.

Additional Enterprise capabilities extend beyond the open-source experience. They include evidence-based software engineering workflows and privacy-focused use of an internal device network.

Open-source capabilities

Explore the available open-source functionality, inspect the implementation, and understand how NexPath fits into your development workflow.

Context Engineering

Context Engineering helps preserve useful project knowledge and make relevant context available across development tasks and coding agents.

Additional Enterprise capabilities

Enterprise capabilities extend the experience with supported advanced software engineering workflows and privacy-focused local-model infrastructure.

These capabilities are intended for developers and organizations with additional requirements around engineering practices, infrastructure, and data handling.

11. FAQ

Frequently Asked Questions

Is NexPath another AI coding agent?

No. NexPath is designed to work alongside coding agents. It improves the surrounding workflow through prompt enhancement, context engineering, and supported human-in-the-loop capabilities.

What does NexPath's human-in-the-loop approach mean?

It means keeping developers involved where their judgment, decisions, or intervention matter, while reducing unnecessary manual work through supported automation.

What is Prompt Enhancement?

Prompt Enhancement improves the clarity, structure, and relevant engineering guidance of a developer's request before the coding agent acts.

Does NexPath automatically enhance prompts?

Supported automatic prompt enhancement can run without requiring the developer to approve every enhancement in advance. A six-second cancellation window allows the user to stop the automatic enhancement when necessary.

What is Context Engineering?

Context Engineering helps make relevant project information available for the task at hand. NexPath's approach includes long-term context and pattern recognition intended to help retrieve useful information beyond the current conversation.

Can I switch between different coding agents?

NexPath's multi-agent workflow direction supports working with different coding agents according to the task, while helping maintain relevant project context across transitions.

The exact integrations and switching capabilities depend on the supported workflow.

What does Data Privacy Mode do?

When correctly configured, Data Privacy Mode restricts supported model inference to designated internal models rather than external model APIs. Its exact guarantees depend on the implementation and the workflow being used.

Can I use my own GPU?

Compatible local models can use supported GPU hardware. Performance and suitability depend on the GPU, available memory, model requirements, and the task.

Can NexPath run testing and verification in the background?

Supported background workflows can help execute suitable tasks without requiring continuous attention. Developer input may still be needed when clarification, approval, or engineering judgment is required.

Will background mode reduce my costs?

It can help reduce token expenditure when suitable tasks are handled by less expensive models or agents. Actual savings depend on the task, the models used, the pricing structure, and the amount of work delegated.

Where are premium features available?

Premium features are currently available through the NexPath Desktop App. The Browser Extension, VS Code Extension, and CLI provide their respective supported functionality but should not be assumed to include the same premium capabilities.

Is NexPath open source?

NexPath has an open-source foundation, with its available open-source functionality documented in the project repository. Additional Enterprise capabilities extend the experience for more demanding workflows.

Does NexPath replace software testing or developer judgment?

No. NexPath can support verification workflows and help improve engineering guidance, but it does not eliminate the need for appropriate testing, review, and developer judgment.

12. FINAL CTA — UPDATED

Build with better context. Automate the routine. Stay in control.

NexPath helps you work with AI coding agents more effectively through better prompts, relevant project context, privacy-focused local workflows, and background execution for suitable tasks.

Keep your attention on the engineering decisions that matter while NexPath helps make the surrounding workflow more efficient.

Secondary CTA: Explore GitHub

Closing line:
Better software engineering starts with a better way to work with AI.

Change map for review

- The original Prompt Enhancement section, Context Engineering section, SWE-Bench section, Privacy & Security section, What NexPath Is — and Isn't section, and FAQ are retained in the first-version wording.
- The standalone Multi-Agent Workflow material is included as a subsection of Enterprise Privacy & Internal Device Network.
- GPU material is included as a subsection of Enterprise Privacy & Internal Device Network. Local inference is described as automatic for suitable tasks in the configured privacy mode.
- Background Mode is retained as its own section and updated to cover user-initiated or surfaced verification work, time savings, token-cost optimization, and returning the developer to the loop when needed.
- Supported Workflow is updated to say premium capabilities are available through the Desktop App only. The other interfaces are described only as offering their respective supported functionality.
- The open-source and Enterprise section is updated to distinguish the open-source Prompt Enhancement and Context Engineering foundation from the additional Enterprise capabilities.
- The Hero and final CTA use **Join Waitlist** as the primary CTA button. No download CTA is used.
- Privacy wording still needs implementation review to confirm that all supported data flows honor the Data Privacy Mode guarantee and do not fall back to external model APIs.
